

# Comparison of Obscuration in NGC 3783 with NGC 5548

Jelle Kaastra

SRON & Sterrenwacht Leiden

# The NGC 5548 campaign

# Set-up campaign

- 14 x 50 ks with XMM-Newton (RGS, EPIC, OM)
- 6 x HST/COS
- 4 x NuSTAR
- 4 x INTEGRAL
- 3 x Chandra LETGS
- Daily Swift monitoring (XRT, UVOT)
- Ground-based support (Israel, Chile)
- Core June/July 2013, 2 observations ½ year later

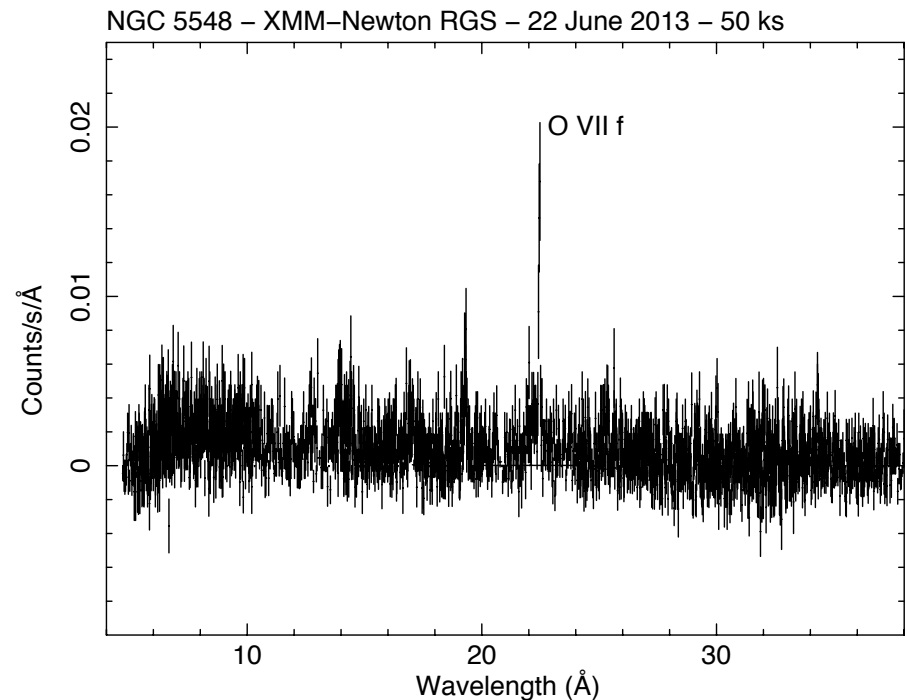

# Four big surprises

- 1) Low-ionisation UV lines never seen before
- 2) No RGS data?
- 3) Strongly absorbed X-ray spectrum EPIC
- 4) Broad UV absorption lines

# Four big surprises

- 1) Low-ionisation UV lines never seen before
- 2) **No RGS data?**
- 3) Strongly absorbed X-ray spectrum EPIC
- 4) Broad UV absorption lines

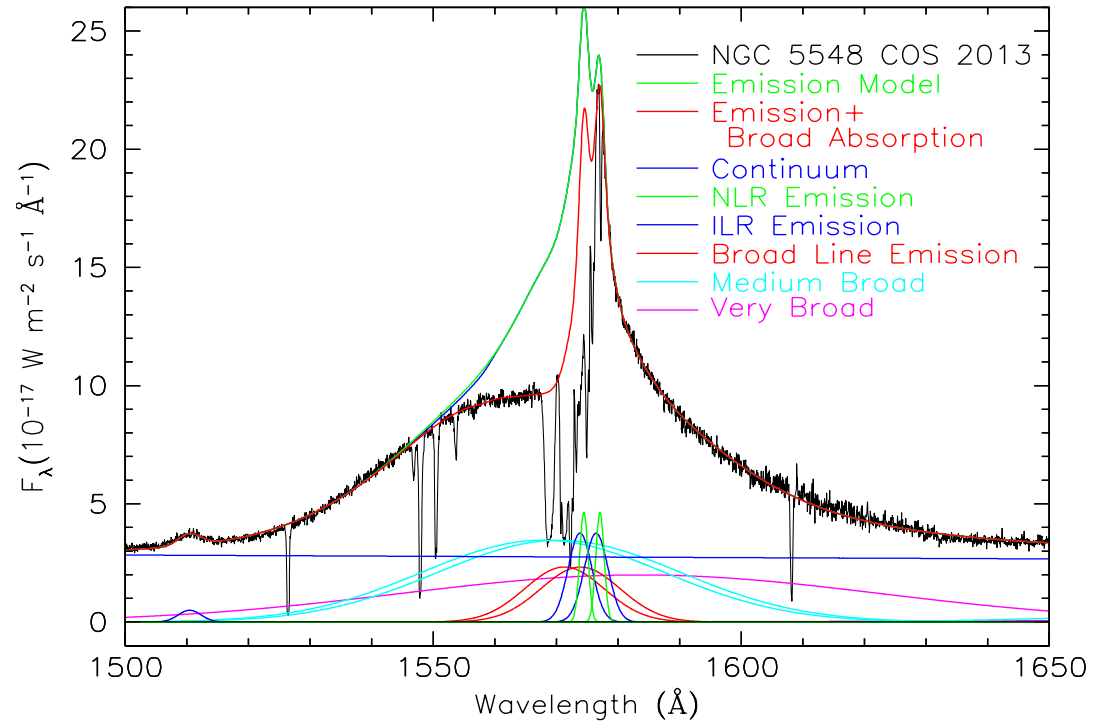

# Four big surprises

- 1) Low-ionisation UV lines never seen before
- 2) No RGS data?
- 3) Strongly absorbed X-ray spectrum EPIC**
- 4) Broad UV absorption lines

# Four big surprises

- 1) Low-ionisation UV lines never seen before
- 2) No RGS data?
- 3) Strongly absorbed X-ray spectrum EPIC
- 4) **Broad UV absorption lines**

# Strong absorption but normal high-E flux

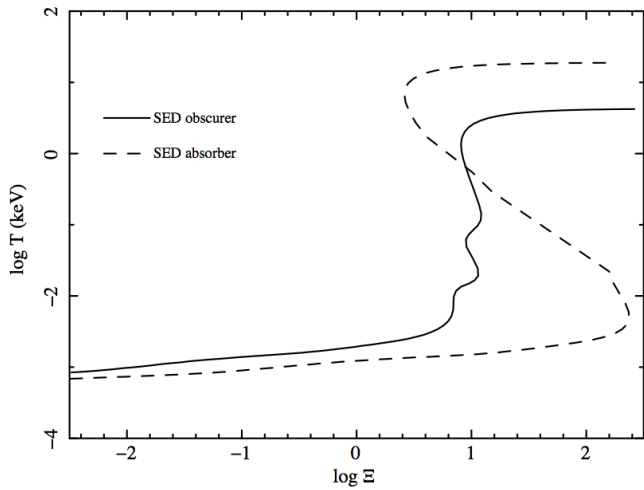

# What is going on?

# Obscured SED modeling

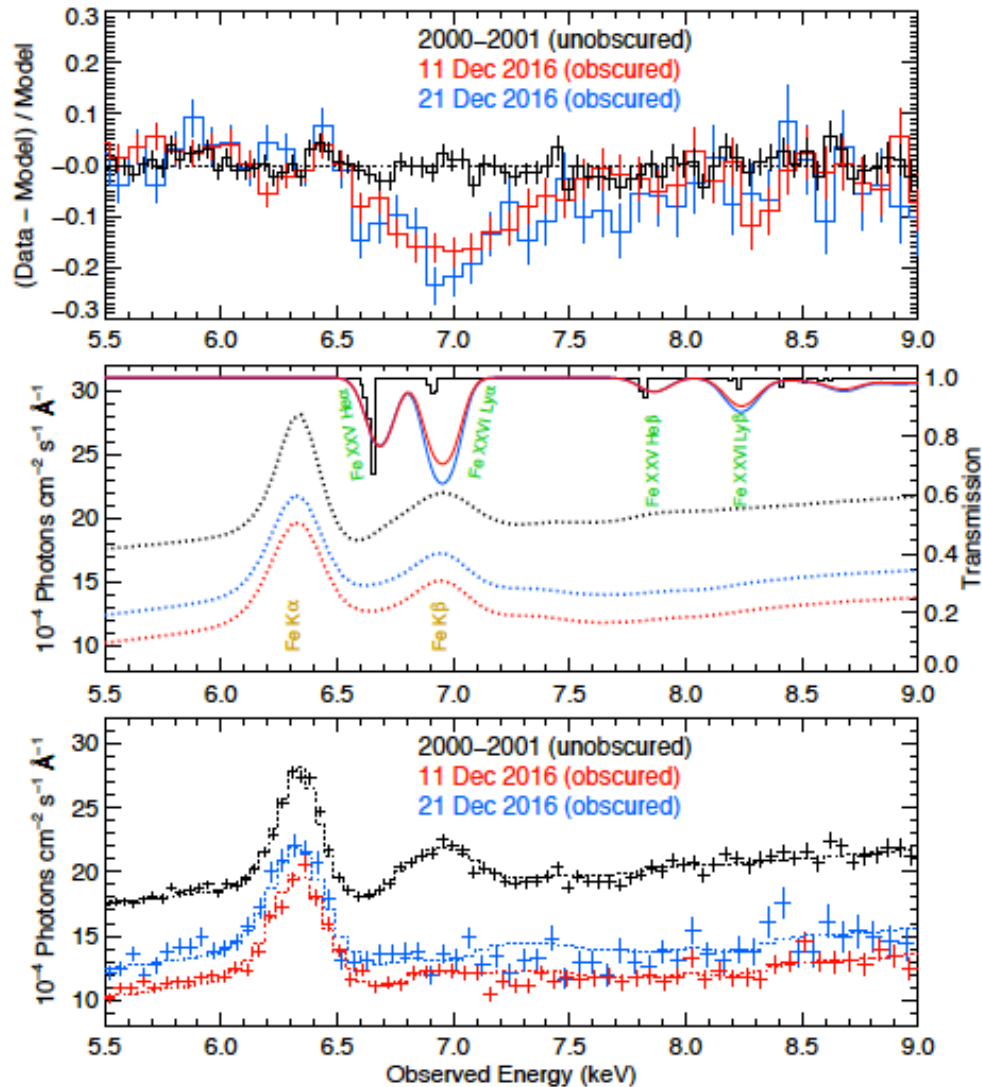

# NGC 3783

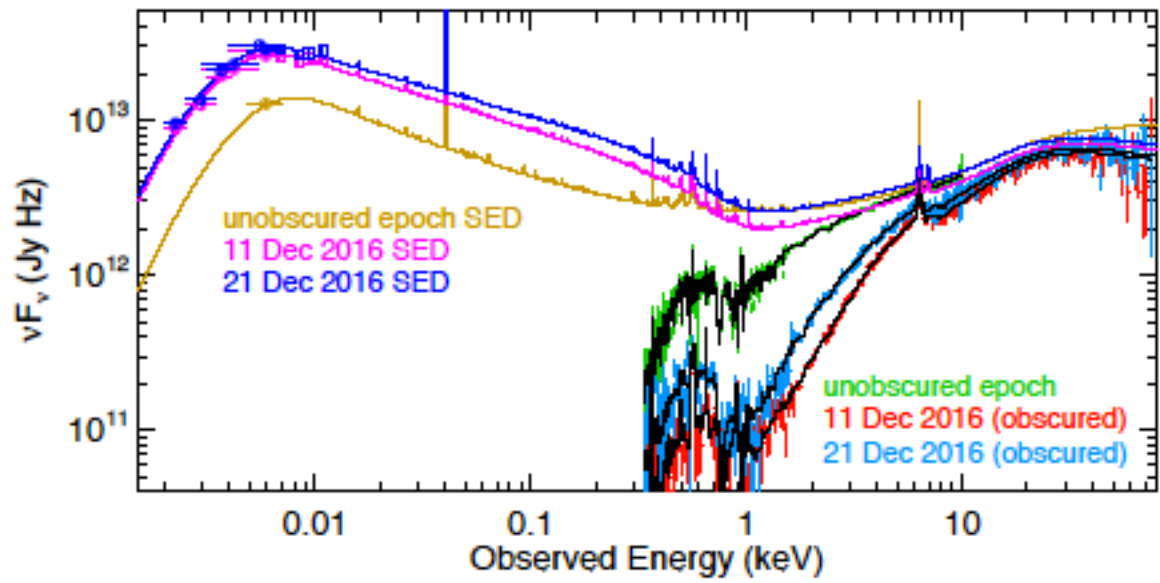

# New high-ionisation component

# Complex modeling

- Need model with *48 components*
- Includes 16 *pion* components, all stacked and influencing each other
  - 2 for the emission lines
  - 11 for the WA (different  $\nu$ ,  $\xi$ )
  - 3 for the obscurer
- 19 free parameters ( $L/\xi$  is fixed)
- Fit: optical to hard X-ray spectrum
- *80 s* calculation time per full model allows interactive fitting
- Details: see paper: [Mehdipour et al. 2017](#)

# Comparison between sources

# Comparison of sources

	NGC 5548	NGC 985	Mrk 335	NGC 3783
Components	2	1	?	3
$N_H$ ( $10^{26} \text{ m}^{-2}$ )	1 & 10	2	?	20 & 5 & 2
$\log \xi$	-1 & <-2	-1	?	-1.8 & -1.8 & 3.7
$F_{\text{cov}}$ (X-ray)	0.86 & 0.30	0.92	?	0.4 & 0.5 & 1
UV Center (km/s)	-1000 (up to -6000)	-6000	-6500	-1900 & -1900 & -2300
UV FWHM	3000	1400	750	2500 & 2500 & 6000
UV depth	40%	25%	15%	30 %
Duration	> 6 years continuous	> 18 month??	Frequently, month?	1 month

# Questions

- what is the difference between obscuration and an eclipse?
- What are the timescales for obscuration: weeks, years, centuries?
- where is the obscuring stream originally born and how?
- is there a connection between certain accretion disk behavior and the obscuration?
- What fraction of the AGN continuum is covered by the obscuration?

# Spectral modeling

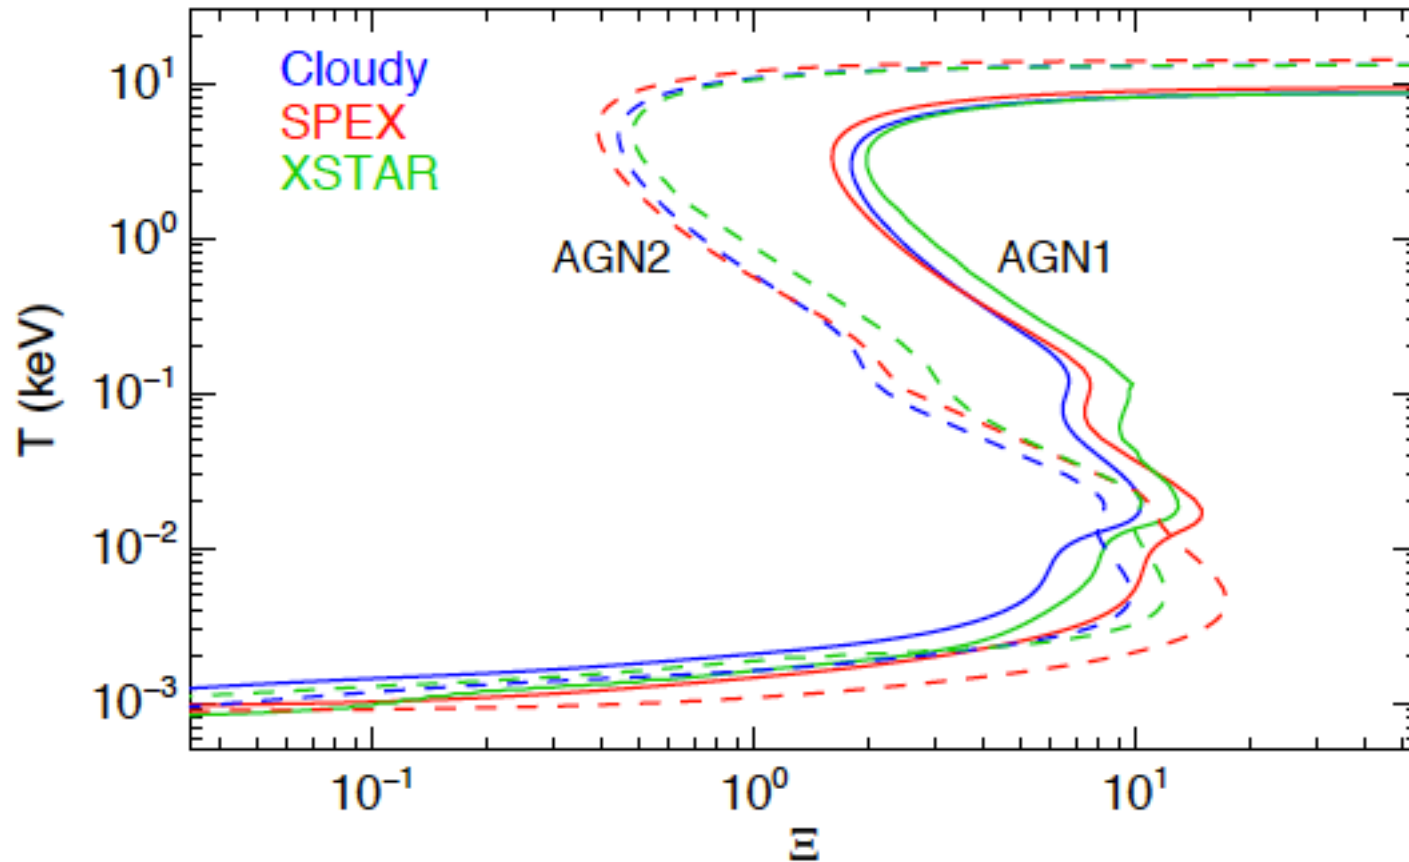

# Advantage pion model

(within SPEX package, [www.sron.nl/spex](http://www.sron.nl/spex))

- No need to pre-calculate grids of models
- Can use fitting on the fly, including ionizing SED
- Reasonably fast (best fit of **very** complex model obtained in a few hours)

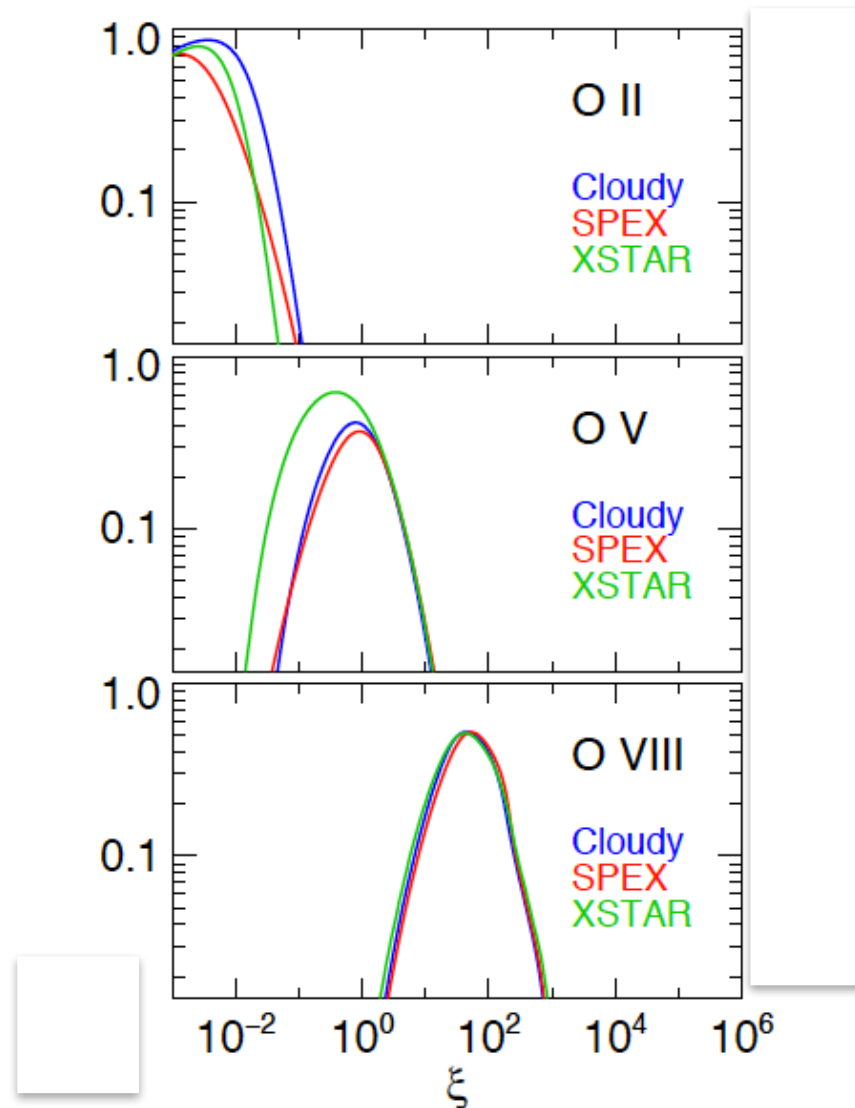

# Differences between codes

(Mehdipour et al. 2016)

(Radiation pressure / gas pressure)

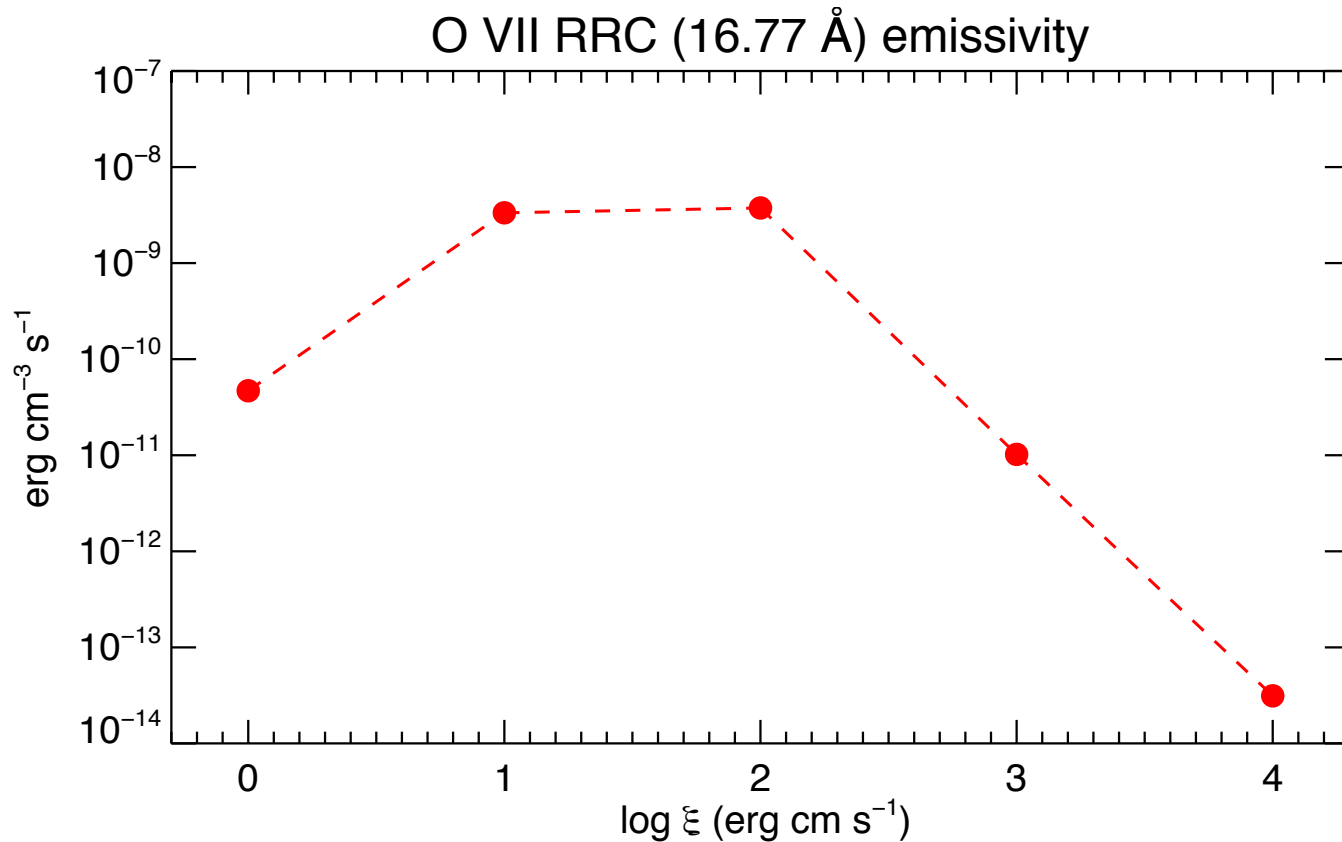

# Comparison ion concentrations: effects of different dielectronic recombination rates?

# Example RRCs: Cloudy calculation

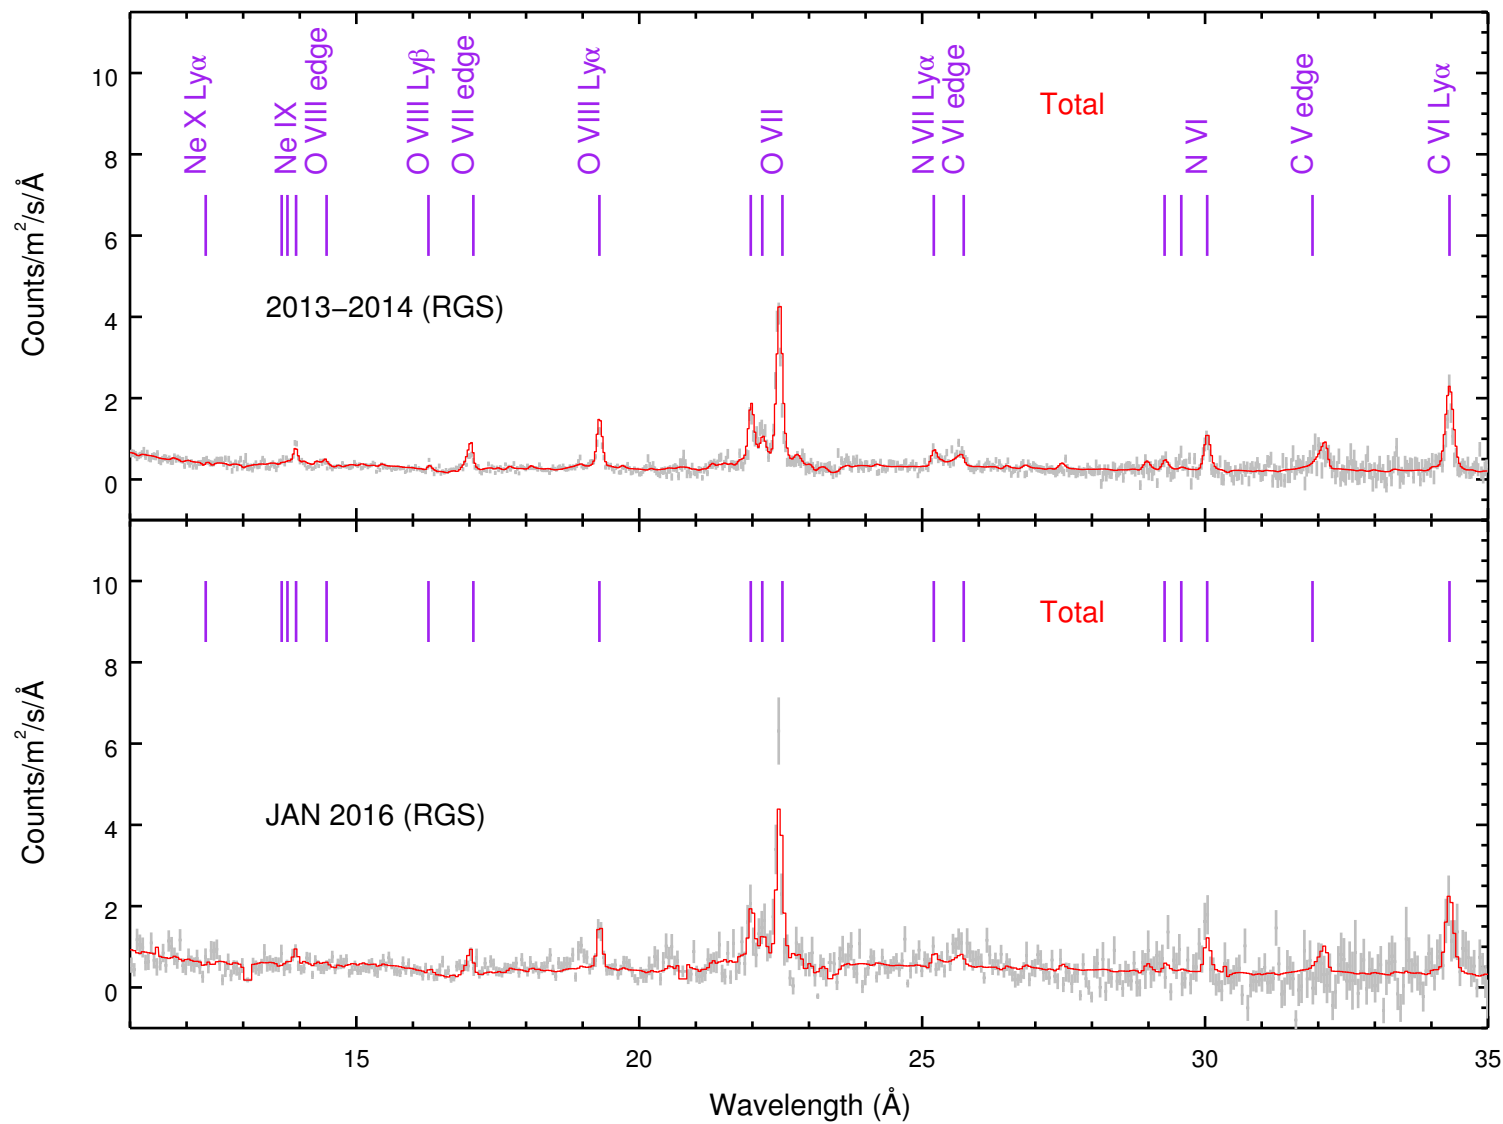

why not monotonic decrease?

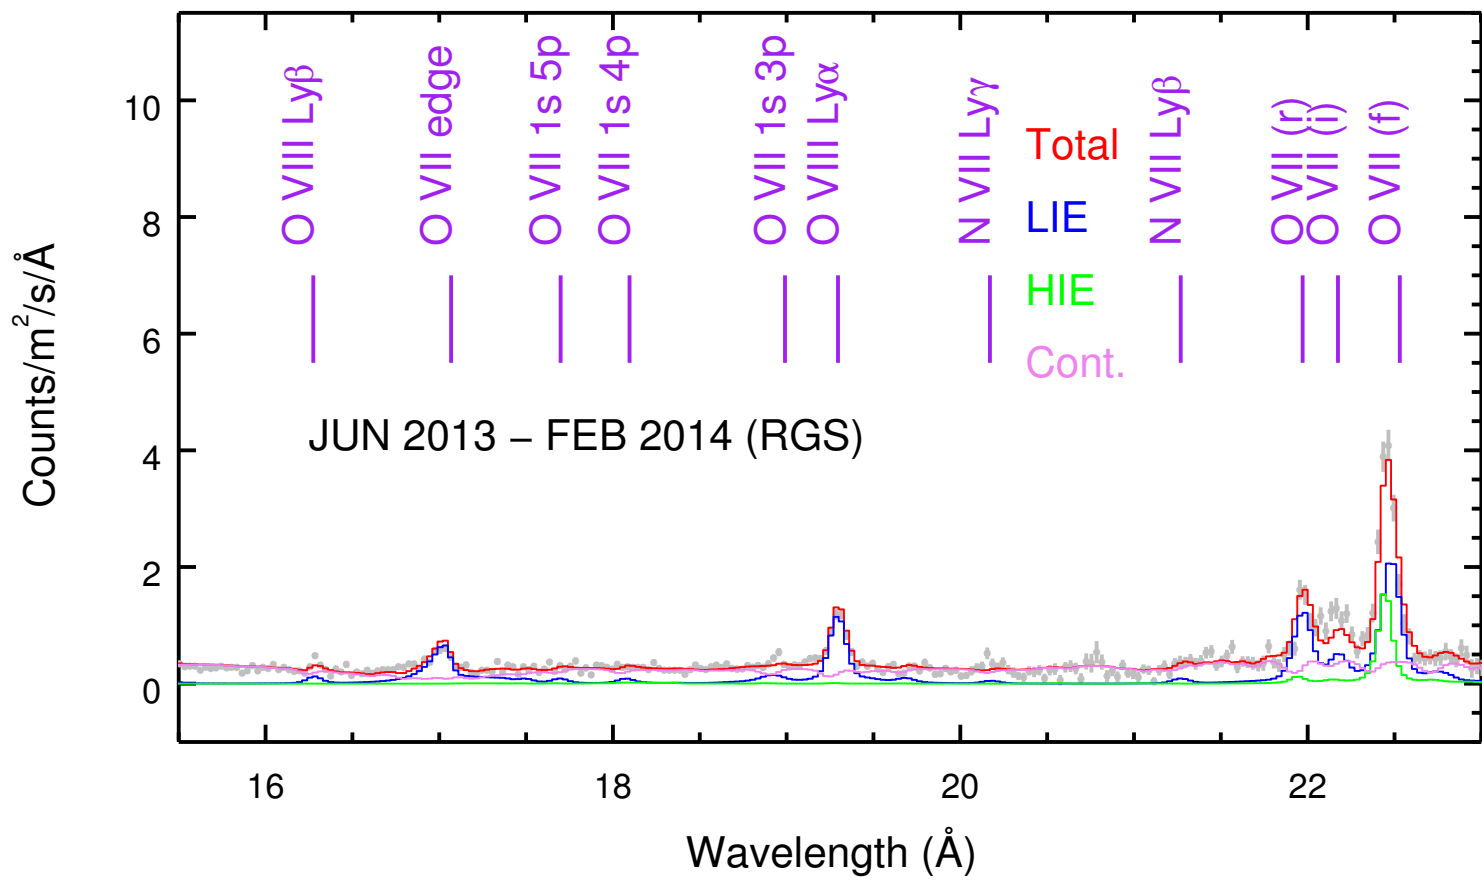

# Physical model NGC 5548

Junjie Mao

- Full modeling RGS+pn spectra
- Continuum COMT+PL+REFL (cf. Mehdipour+2015)
- Obscurer: 2 x xabs model (Kaastra+2014)
- Outflow: 6 x PION (de-ionized) (Mao+2017)
- Emitter: 2 x PION

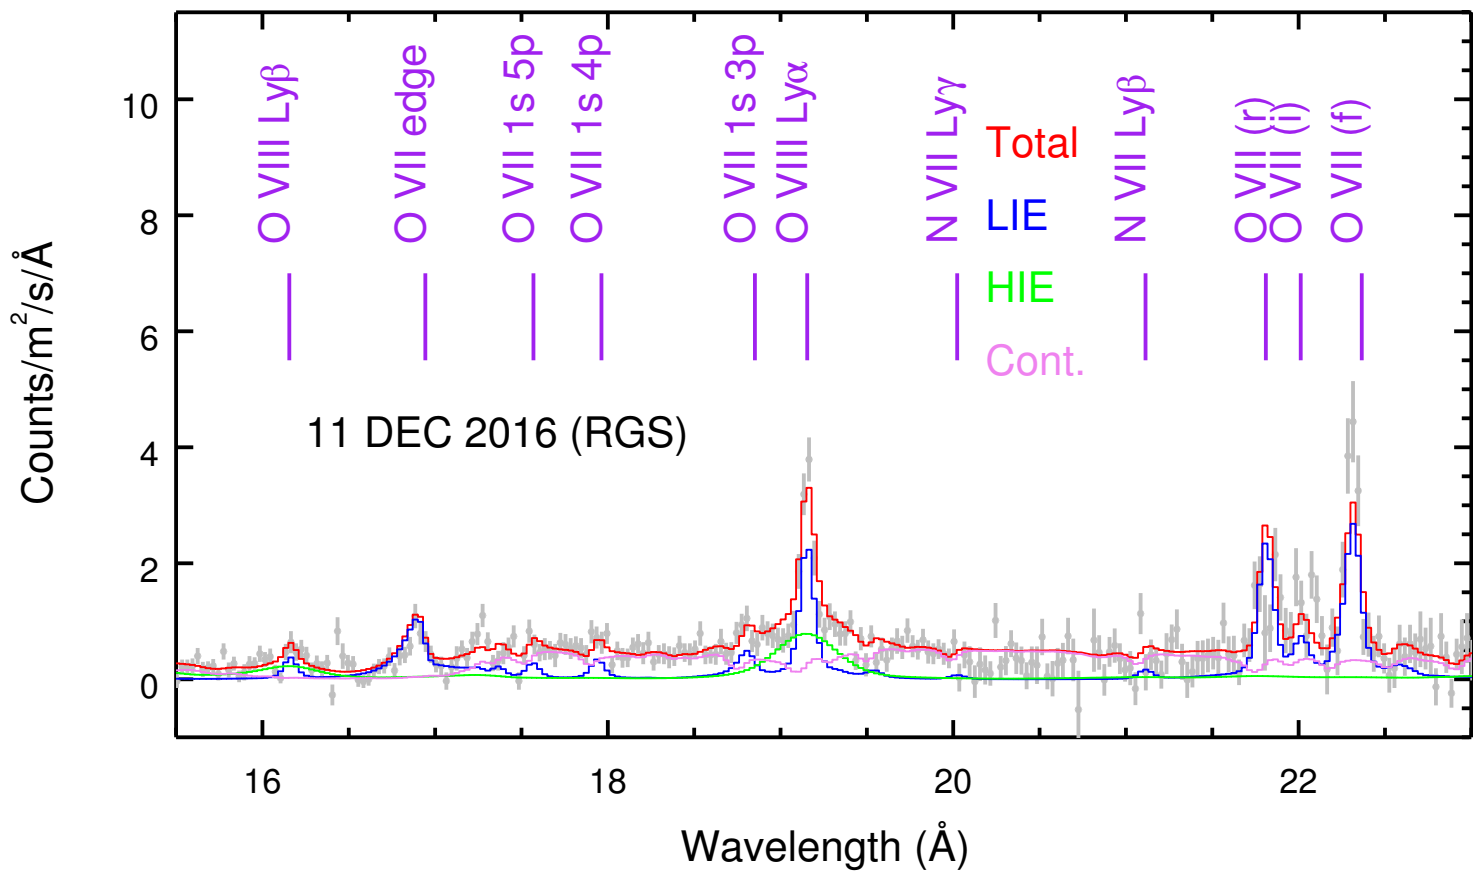

# X-ray NLR in NGC 5548 (Junjie Mao)

Parameter/Component	1	2
$N_H$ ( $10^{26} \text{ m}^{-2}$ , $10^{22} \text{ cm}^{-2}$ )	1.03	0.32
$\text{Log } \xi$	1.18	0
$\sigma_v$ (km/s)	485	250
Outflow (km/s)	0	-460
$\Omega/4\pi$	0.029	0.006

# X-ray NLR in NGC 3783 (Junjie Mao)

Parameter/Component	1	2
$N_H$ ( $10^{26} \text{ m}^{-2}$ , $10^{22} \text{ cm}^{-2}$ )	17.3	0.45
$\text{Log } \xi$	2.55	1.31
$\sigma_v$ (km/s)	2510	350
Outflow (km/s)	0	0
$\Omega/4\pi$	0.005	0.05

# What is the obscurer and where is it?

- UV BLR covered by 20-40% → R 2-7 lightdays from core ( $\sim 10^{14}$  m)
- WA de-ionized →  $R < 3$  pc ( $10^{17}$  m)
- $F_{\text{cov}}$  high → likely close to BLR
- High velocity up to 5000 km/s → close to BLR
- Variations in obscuration @ 2 days: for size  $\sim 20GM/c^2$  and  $M = 4 \times 10^7 M_{\text{sun}}$ , needed crossing velocity  $\sim 3000$  km/s → comparable to  $v_{\text{rad}}$
- Line of sight inclined by about 30 degrees (Pancoast et al. 2014) → predominantly poloidal outflow (from accretion disk?)

# Obscuring stream

- *Two components:*
- **Main:**  $\log \xi = -1.2$ ,  $N_{\text{H}} = 10^{26} \text{ m}^{-2}$ ,  $f_{\text{cov}} = 0.86$  (X-ray) and  $\sim 0.3$  in UV; produces UV BAL
- **Second:** almost neutral,  $N_{\text{H}} = 10^{27} \text{ m}^{-2}$ ,  $f_{\text{cov}} = 0.3$  (X-ray) and  $< 0.1$  in UV
- Partial covering inner BLR,  $v$  up to 5000 km/s, inside WA  $\rightarrow$  distance few light days ( $\sim 10^{14} \text{ m}$ , 0.003 pc)
- Obscuration already 3 years ongoing
