**ANNOUNCEMENT**

The Ramón María Aller Observatory at the University of Santiago de Compostela, Spain, has completed its first Catalogue of Orbits and Ephemerides of Visual Double Stars. At the International Workshop held in Santiago de Compostela in 1996 it was announced that this Catalogue would be heir to the ephemerides catalogues edited at the Nice Observatory by Muller, Meyer, and Couteau, Morel and Fulconis; however, it has been extended to include orbits, and now lists orbits up to the end of the year 2000.

In our orbital selection, it has been our basic criterion to not replace any early orbit except for those reasonably improved by subsequent one. We believe that it will make a welcome companion to the USNO 5th Orbit Catalog, of interest to both Commission 26 members and astronomers in general.

In all, the new Catalogue contains 1545 orbits for 1208 systems. Each binary has been assigned a letter (A, B or C) indicating its current status as regards the possibility of calculating a reliable orbit. This classification has been carried out on the basis of the arc described, the number and nature of the available observations, and/or whether closely similar orbits have been calculated independently by different authors. Notes indicate the existence of other components of the system, whether it is also a spectroscopic binary, whether it has an astrometric orbit, etc.

The elements of each orbit are accompanied by a reference to the original publication, the ephemerides will be predicted within the next few years, and letters indicating such information as the equinox to which the node is referred, or whether the elements of the orbit as originally published were flawed by typographical errors. New orbits will be included as they become available.

The Catalogue may be consulted on-line via internet at  
<http://www.usc.es/astro/catalog.htm>
