## ANNOUNCEMENT

### THE CCDM

A Catalog of Double and Multiple Stars in the continuation of the ancient ones.

In the years before 1980, the idea of a very important astronomical space project was born in the French astronomical community and after a few year of discussions, it rapidly took shape. This idea was disseminated outside of France, especially in European and American countries.

Meetings were organized and finally the European Space Agency (ESA) became involved. The project of the launch of a specific European Astrometric Satellite was accepted. Therefore, the contributions of the participating European Countries consisted of setting up three consortia: INCA, FAST, and NDAC, to:

- a) prepare the launch of the satellite,
- b) follow the mission, and
- c) take charge of the data reductions.

This organization officially started working in the year 1980.

The project consisted of observing 120,000 stars with INCA (INPUT CATALOG CONSORTIUM) in charge of the list. This list was called the INPUT CATALOGUE and contained a specific sub-list of double and multiple stars.

Thus, FAST and NDAC were apparently not immediately involved but they had to prepare their programs for data reduction.

Starting from a copy of the INDEX (1976.5)<sup>1</sup> of which the format was fundamentally

---

<sup>1</sup>As mentioned in all of our publications on the subject.

changed (as imposed by the need for the satellite to receive individual data for each component), a sub-list of 14,711 systems was realized (Annex 1; vol 6, Double and Multiple Systems of the Input Catalog, C. Turon et al.) for the launch of the satellite on July 9, 1989.

After the Hipparcos launch, it seemed useful to publish this sub-list which had increased to 34,031 systems (Communications de l'Observatoire Royal de Belgique, Série A, n° 115, 1994) under the name of “*Catalog of the components of double and multiple stars*”(CCDM).

The INDEX created by C. E. Worley, evolved with the new name, the “*Washington Double Star Catalog*” (WDS).

Today, the CCDM contains some 68,000 systems (much less than the 116,000 of the WDS). But it contains an important improvement, contributed by Omer Nys, a co-author of the Catalog who, while retired, continued his very important work from the second edition (Observations et Travaux, n° 51, January 2007) until his death in January 2007. This contribution could have been lost if not accurately recorded.

Both the WDS and CCDM catalogues are issued from the INDEX around the years 1975-1980, but evolved differently afterwards. The main difference between the two catalogues lies in their formats: while the WDS has one registration for each double star (even inside multiple systems), the CCDM has one registration for each component. This was necessary in order to assign only one piece of data per parameter.

The second edition (Observations & Travaux) contained only 49,300 systems. A detailed description will be published in O&T as soon as possible. We expect this event in mid-July 2012.

J. Dommangelet

## KARL DRAGUTIN RAKOS (1925-2011)

A native of Croatia in the former Yugoslavia, Karl Rakos earned his doctorate at the University Graz, Austria, in 1956. Soon thereafter he joined the Institute for Astronomy of the Vienna University, his home for the balance of a distinguished scientific and academic career. His research, from stellar astronomy to population studies in galaxies, included photometric and astrometric investigations of visual binaries by photoelectric area scanning, a technique of his creation. In recognition of his contributions to binary-star research, Commission 26 elected him as its president for the term of 1985-1988.

With the death of Professor Karl D. Rakos, the astronomical community has lost an exceptionally creative and productive member. However, his legacy will live on through the significant contributions he has made to his beloved science, and in the careers he has launched and fostered as an inspiring teacher and caring mentor.

Otto Franz
